

Internship Project - Laravel Hotel Management System

ABSTRACT :

This paper presents a comprehensive booking system for hotels and resorts, developed using the PHP programming language with the Laravel framework. The system aims to streamline the booking process and enhance the management of booking requests, ultimately improving the overall guest experience and operational efficiency. By automating key tasks and providing a user-friendly interface, the system simplifies the reservation process, reduces errors, and increases the accuracy of booking management.

OBJECTIVE :

The objective of this project is to develop a robust and user-friendly booking system for hotels and resorts. The system will provide a centralized platform for guests to submit booking requests and for staff to manage and track the status of bookings. The key objectives include:

1. **Simplify the Booking Process:** The system will offer a user-friendly interface where guests can easily search for available rooms, select their preferred dates, and make bookings. The system will guide guests through the process, ensuring that all necessary information is captured accurately.
2. **Enhance Guest Experience:** The system will provide a seamless and convenient booking experience for guests. It will offer features such as room preferences, special requests, and online payment options. By providing a user-friendly interface and efficient booking management, the system aims to exceed guest expectations and increase customer satisfaction.

By achieving these objectives, the common booking system will serve as a valuable tool for hotels and resorts, facilitating efficient booking management, enhancing guest satisfaction, and improving overall operational performance.

INTRODUCTION :

In the hospitality industry, effective management of booking requests is crucial for the smooth operation of hotels and resorts. Traditional manual booking systems can be time-consuming and prone to errors, leading to customer dissatisfaction and revenue loss. To address these challenges, an automated booking system using PHP and Laravel is proposed.

The proposed system offers a user-friendly interface for guests to submit their booking requests. It includes features such as selecting booking name, specifying dates, and providing additional preferences. The system also provides an administrative interface for staff members to manage bookings, including viewing and updating reservation details.

METHODOLOGY :

The development of the common booking system involves several steps. Firstly, the database schema is designed to store information about guests, bookings, webpages and other relevant data. The Laravel framework's database migration feature is utilized to create and modify the database structure seamlessly.

Next, the system's user interface is developed using Laravel's blade templating engine, which allows for efficient rendering of HTML views. The interface includes forms for guests to submit booking requests and for staff to manage bookings. These forms are validated to ensure the accuracy and integrity of the data.

The system's logic is implemented using PHP and Laravel's built-in features. This includes handling form submissions, validating input, querying the database, and updating booking statuses. Laravel's Model-View-Controller (MVC) architectural pattern is followed to ensure separation of concerns and maintainable code.

The System contains one Home Page and then two modules of user login and admin login.

Home page of the website has a navbar which contains the icon of the hotel booking system along with the dynamic pages of Team, About Us and Contact Us. It also has a carousel of the images of the hotel rooms, Buffet Lunch/Dinner/Breakfast. And after that the Dummy images of the founder Manager and Treasurer of the Hotel company. It also has the links to the social media accounts of the hotel and main members of the hotel management. The new user can have a look at the pages of the website.

From the login page the admin or the user can login using their credentials and new users can register themselves via the registration form link at the signup page whose link is on the login page.

Admin Login Credentials(bms@yopmail.com/secret)

Admin Dashboard contains a side bar which has Dashboard, Bookings section, Webpage section, User section and the admin profile section in it. On the dashboard it displays the total number of users, admin users and Client users. It also has Total booking and completed booking count. Also, Total webpages and active webpages. Through the bookings sections the admin can allocate a particular room for the user or set the status of booking for a user. Via Webpage section the admin can dynamically add a new webpage on the website or update existing one. Via User section the admin can keep a track of all the users in the hotel. The admin can also add a new user or update the existing user via this section. The profile section has the details of the Admin. Admin can view or update it as required.

User Login Credentials(ksbcell12@gmail.com/secret)

User Dashboard has a side bar but only with the dashboard, booking and view/edit Profile section. On the dashboard the user can see the total bookings and the completed bookings. In the booking section the user can add a new booking or update the booked hotel status as he/she wants. In the profile section user can view or edit their profile.

Both the admin and user can sign-out via the sign-out button at the top right corner. After that they get redirected to the login/signup page.

The image shows a login page with a light blue background. In the center, there is a white rectangular box containing the login form. At the top of the box is a circular logo with a stylized 'A' and the text 'Apptitude' below it. Below the logo, the word 'Login' is centered. Underneath, the text 'Kindly Provide Your login Credentials' is displayed. The form includes two input fields: 'Email Address' with a placeholder 'Email' and 'Password' with a placeholder 'Password'. Below these fields is a blue 'Login' button. At the bottom of the box, there is a link that says 'Dont Have an Account? Click to Signup'.

Fig 5: Login Page

The image shows a sign-up page with a light blue background. In the center, there is a white rectangular box containing the sign-up form. At the top of the box is a circular logo with a stylized 'A' and the text 'Apptitude' below it. Below the logo, the word 'Signup' is centered. Underneath, the text 'Kindly Provide Your Information for Registration' is displayed. The form includes five input fields: 'Name' with a placeholder 'Name', 'Email Address' with a placeholder 'Email', 'Phone Number' with a placeholder 'Phone Number', 'Password' with a placeholder 'Password', and 'Confirm Password' with a placeholder 'Password'. Below these fields is a blue 'Login' button. At the bottom of the box, there is a link that says 'Already Have an Account? Click to Login'.

CONCLUSION :

In conclusion, the common booking system developed using PHP and the Laravel framework provides an efficient and reliable solution for managing booking requests in hotels and resorts. The system streamlines the booking process, improving accuracy and customer satisfaction. By automating various tasks, it reduces the workload on staff, allowing them to focus on providing exceptional service to guests. The system's user-friendly interface and robust functionality make it an ideal choice for any hotel or resort seeking to enhance their booking management capabilities.
